

## Grapple for Forklift

Forklift Grapple - On excavators, grapples can be used along with the crowing operation of the bucket cylinder. They can mount directly to the jib and can be used when processing and handling construction materials, domestic or aggregate waste items, and timber. The grapple's boxed design has additional support bridging. This manufactured design provides the grapple with utmost support and strength by way of preventing the body from breaking and rotating through its operation.

The grapple and all of its moving parts are made out of hardened steel. The rotating points are designed to be able to guarantee holding ability and supreme closing force. The operator has the capacity to handle different sizes and varieties of supplies using the jaws fitted at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for maximum handling capacity.
