

Truss Jibs

Truss Jib - A truss jib is actually utilized in order to pick up and position trusses. It is actually an extended jib attachment that is outfitted with a triangular or pyramid shaped frame. Normally, truss jibs are mounted on equipment like a skid steer loader, a compact telehandler or a forklift using a quick-coupler attachment.

Older kind cranes that have deep triangular truss jibs are normally assemble and fastened using bolts and rivets into standard open structural shapes. There are hardly ever any welds on these style jibs. Every riveted or bolted joint is prone to rusting and thus requires frequent maintenance and check up.

Truss jibs are designed with a back-to-back collection of lacing members separated by the width of the flange thickness of an additional structural member. This design can cause narrow separation among the flat exteriors of the lacings. There is limited access and little room to clean and preserve them against corrosion. A lot of bolts loosen and rust in their bores and must be replaced.
